US-CL-CURRENT: 562/857

**ABSTRACT:**

PURPOSE: To obtain a carboxylic acid chloride in high yield and quality, by the reaction of an organic carboxylic acid (anhydride) with phosgene fed at such a rate as not to detect the unreacted phosgene in the waste gas, to the end point of the reaction.

CONSTITUTION: An organic carboxylic acid (anhydride), e.g. phthalic, tetrahydrophthalic or succinic acid, is reacted with phosgene in the presence of a catalyst, e.g. dimethylformamide, at 50□120°C, preferably 70□90°C, to give the corresponding carboxylic acid chloride. Phosgene is fed at such a rate as not to detect the unreacted phosgene essentially in a waste gas, almost to the end point of the reaction.
